A wave pool works by having the walls slide closer together or farther apart, causing the water to rise or fall in the process. At one time, the length of the pool was 10 meters, the width was 8 meters, and the depth was 2 meters. At this moment, the length was decreasing at a rate of 0.2 m/s, and the depth was 2 meters. At this moment, the length was decreasing at a rate of 0.2 m/s while the width was increasing at 0.3 m/s. Find the exact rate at which the depth of the water is changing at this point in time. Make sure to state whether the water is rising or falling.
